Topic 05: Exploratory Data Analysis2

Part 01: EDA Pass3

Dr Bernard Butler

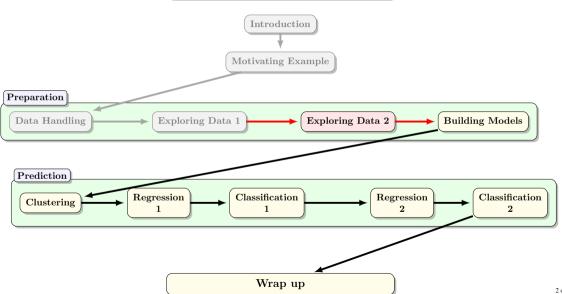

Department of Computing and Mathematics, WIT. (bernard.butler@setu.ie)

Autumn Semester, 2025

Outline

- EDA Phase 3
- Datasets = Tips, Titanic and Algae Blooms
- Identifying and resolving issues (missing value, outliers)
- Generating ToDo list for Feature Engineering/Transformation/Selection

Data Mining (Week 5)

EDA Pass3 — Summary

- 1. Review of previous week
- 2. Second Pass Individual Features and Target
- 2.1 Targe
- 2.2 Individual Features
- 3. Third Pass Relationships Between Features and Target
- 3.1 Correlations
- 3.2 Multi-relation Plots
- 4. Visualisation selection of seaborn plots
- 5. Resources

Acknowledgment

A big thanks to Dr Kieran Murphy, who provided some of the slides for today's lecture.

Recall statistical *Levels of Measurement*

Recall statistical Levels of Measurement

Туре	Drawn from	Examples	Used to			
Nominal	Finite Set, Unrelated	Manufacturers, Countries, Gender	Categorise with descriptive label			
Ordinal	Finite Set, Ordered	Size (S,M,L), Army Ranks, Satisfaction	Categorise with descriptive label			
Interval	Ordered, Differences matter	Exam Scores, Temperatures (Celsius)	Assign numeric score to			
Ratio	Ordered, Differences and ratios matter	Distance (m), Cost (\$), Temperatures (Kelvin)	Assign numeric score to			

Recall statistical *Levels of Measurement*

Туре	Drawn from	Examples	Used to			
Nominal	Finite Set, Unrelated	Manufacturers, Countries, Gender	Categorise with descriptive label			
Ordinal	Finite Set, Ordered	Size (S,M,L), Army Ranks, Satisfaction	Categorise with descriptive label			
Interval	Ordered, Differences matter	Exam Scores, Temperatures (Celsius)	Assign numeric score to			
Ratio	Ordered, Differences and ratios matter	Distance (m), Cost (\$), Temperatures (Kelvin)	Assign numeric score to			

Generally, *Nominal* and *Ordinal* are considered categorical, *Interval* and *Ratio* are considered Numerical

Recall statistical *Levels of Measurement*

Туре	Drawn from	Examples	Used to				
Nominal	Finite Set, Unrelated	Manufacturers, Countries, Gender	Categorise with descriptive label				
Ordinal	Finite Set, Ordered	Size (S,M,L), Army Ranks, Satisfaction	Categorise with descriptive label				
Interval	Ordered, Differences matter	Exam Scores, Temperatures (Celsius)	Assign numeric score to				
Ratio	Ordered, Differences and ratios matter	Distance (m), Cost (\$), Temperatures (Kelvin)	Assign numeric score to				

Generally, *Nominal* and *Ordinal* are considered categorical, *Interval* and *Ratio* are considered Numerical

But what about a variable which contains *Months of the year*?

Load dataset

- Load dataset
 - Typically either csv or more general "table" format

- Load dataset
 - Typically either csv or more general "table" format
 - Can be local file or url (read over network)

- Load dataset
 - Typically either csv or more general "table" format
 - Can be local file or url (read over network)
- Check variables names

- Load dataset
 - Typically either csv or more general "table" format
 - Can be local file or url (read over network)
- Check variables names
 - Should be meaningful and distinct

Load dataset

- Typically either csv or more general "table" format
- Can be local file or url (read over network)

Check variables names

- Should be meaningful and distinct
- Avoid clashes with reserved words (python or statistical)

- Load dataset
 - Typically either csv or more general "table" format
 - Can be local file or url (read over network)
- Check variables names
 - Should be meaningful and distinct
 - Avoid clashes with reserved words (python or statistical)
- Verify variable types

- Load dataset
 - Typically either csv or more general "table" format
 - Can be local file or url (read over network)
- Check variables names
 - Should be meaningful and distinct
 - Avoid clashes with reserved words (python or statistical)
- Verify variable types
 - Convert strings to categories, possibly grouping, where possible

Load dataset

Check variables names

- Should be meaningful and distinct
- Avoid clashes with reserved words (python or statistical)

Verify variable types

- Convert strings to categories, possibly grouping, where possible
- Ensure numeric data is stored as number (watch out for "Unknown" etc.)

Identify (and possibly address) missing values

Missing values by row or column

Load dataset

- Typically either csv or more general "table" format
- Can be local file or url (read over network)

Check variables names

- Should be meaningful and distinct
- Avoid clashes with reserved words (python or statistical)

Verify variable types

- Convert strings to categories, possibly grouping, where possible
- Ensure numeric data is stored as number (watch out for "Unknown" etc.)

Identify (and possibly address) missing values

- Missing values by row or column
- Leave blank, impute value, drop row/column?

Second Pass — Individual Features and Target

• Categorical vs numerical target

Second Pass — Individual Features and Target

- Categorical vs numerical target
- Categorical vs numerical features
- Identify (and possibly address) issues

Is it usable?

Second Pass — Individual Features and Target

- Categorical vs numerical target
- Categorical vs numerical features
- Identify (and possibly address) issues
- Relationship to target.

Is it usable?

Is it useful?

- Simplest classification problem (two classes) with both classes nearly equal frequency.
- In a unbalanced classification problem where the minority class occurs about 20% or lower, models can focus on the majority class.

25%	1.525000	0.000000	0.000000	0.000000	0.000000	0.000000	0.000000
50%	6.950000	3.000000	1.550000	0.000000	2.000000	0.000000	1.000000
75%	24.800000	11.275000	4.975000	2.400000	7.500000	6.975000	2.400000
max	89.800000	72.600000	42.800000	44.600000	44.400000	77.600000	31.600000

All distributions are heavily skewed to the right, many with outliers (see next slide). All of the zero measurements are probably due to population levels too low to be measured.

```
fig, axs = plt.subplots(1, 7, figsize=(24,6))
for k, c in enumerate(targets):
   sns.boxplot(data=df, y=c, color="lightblue", ax=axs[k])
   axs[k].set_xlabel(c)
```

```
fig, axs = plt.subplots(1, 7, figsize=(24,6))
for k, c in enumerate(targets):
   sns.boxplot(data=df, v=c, color="lightblue", ax=axs[k])
   axs[k].set_xlabel(c)
```

The outliers are likely to be true measurements, but their presence can heavily influence the model training — common strategy is to fit two models (one with the case with target outliers and one without) to assess impact of outliers.

Individual Features

To keep this more manageable we will focus more on the Algae Blooms data set ...

	Season	Size	Speed	max_p	H min_	O2 mean_0	Cl_mean_	NO3 mean	_NH4 mea	n_oPO4	mean_E	PO4 mean_	Chlor	a1 a	2 a

spring	0.0	89.8	16.6	49057	53	23.093786
summer	0.0	64.2	16.0	38636	44	17.920798
autumn	0.0	86.6	17.7	45000	40	21.611203
winter	0.0	81.9	17.4	98361	61	22.568256

 Countplot shows no issues with feature Season — all levels approximately equally represented.

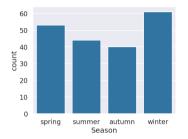

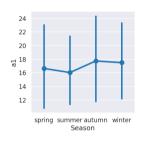

df.groupby("Season")["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Season			\bar{x} n		σ
spring	0.0	89.8	16.649057	53	23.093786
summer	0.0	64.2	16.038636	44	17.920798
autumn	0.0	86.6	17.745000	40	21.611203
winter	0.0	81.9	17.498361	61	22.568256

- Countplot shows no issues with feature Season all levels approximately equally represented.
- Countplots show slightly less spread in a1 for Season="summer" observations.

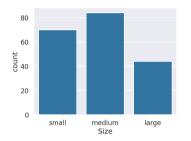

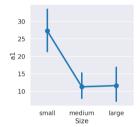

df.groupby("Season")["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Season			\bar{x} n		σ
spring	0.0	89.8	16.649057	53	23.093786
summer	0.0	64.2	16.038636	44	17.920798
autumn	0.0	86.6	17.745000	40	21.611203
winter	0.0	81.9	17.498361	61	22.568256

- Countplot shows no issues with feature Season all levels approximately equally represented.
- Countplots show slightly less spread in a1 for Season="summer" observations.
- No/weak relationship between Season feature and a1 target.

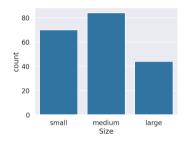

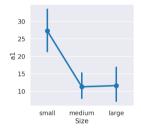

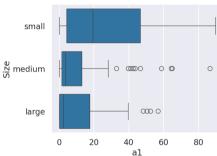

df.groupby("Size")["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Size					
small	0.0	89.8	27.255714	70	24.895426
medium	0.0	86.6	11.267857	84	17.163124
large	0.0	56.8	11.611364	44	16.556123

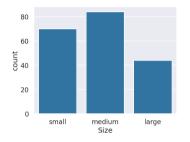

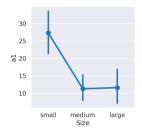

df.groupby("Size")["a1"].agg(["min","max","mean","count","std"])

Size					
small	0.0	89.8	27.255714	70	24.895426
medium	0.0	86.6	11.267857	84	17.163124
large	0.0	56.8	11.611364	44	16.556123

• Countplot shows no issues with feature Size.

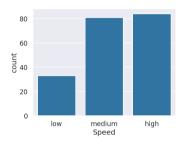

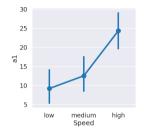

df.groupby("Size")["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Size					
small	0.0	89.8	27.255714	70	24.895426
medium	0.0	86.6	11.267857	84	17.163124
large	0.0	56.8	11.611364	44	16.556123

- Countplot shows no issues with feature Size.
- Size="small" rivers have higher frequencies of a1 alga ((point) catplot), and observed frequencies for small rivers is much more widespread across the domain of frequencies than for other types of rivers (boxplot).

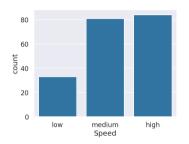

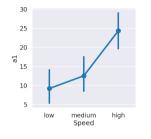

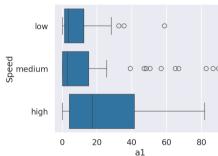

df.groupby("Speed", observed=False)["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Speed					
low	0.0	58.7	9.209091	33	13.164758
medium	0.0	89.8	12.548148	81	21.146986
high	0.0	81.9	24.345238	84	22.209123

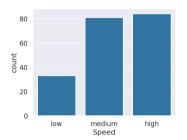

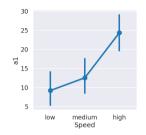

df.groupby("Speed", observed=False)["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Speed					
low	0.0	58.7	9.209091	33	13.164758
medium	0.0	89.8	12.548148	81	21.146986
high	0.0	81.9	24.345238	84	22.209123

• Countplot shows no issues with feature Speed.

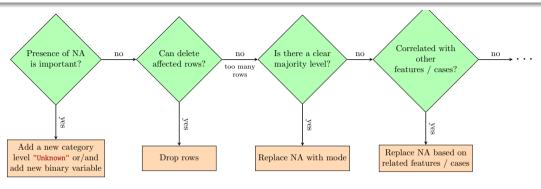

df.groupby("Speed", observed=False)["a1"].agg(["min","max","mean","count","std"])

	min	max	mean	count	std
Speed					
low	0.0	58.7	9.209091	33	13.164758
medium	0.0	89.8	12.548148	81	21.146986
high	0.0	81.9	24.345238	84	22.209123

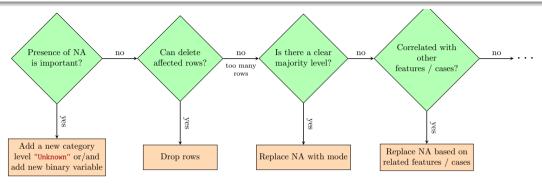

- Countplot shows no issues with feature Speed.
- Speed="high" rivers have average population of a1 alga ((point) catplot), and observed frequencies is much more widespread across the domain of frequencies than for other types of rivers (boxplot).

Categorical Variables — Dealing with Missing Values

In terms of our three datasets, only Titanic has missing values in categorical features:

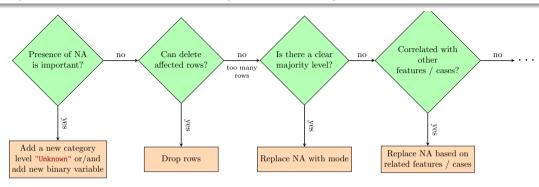

Categorical Variables — Dealing with Missing Values

In terms of our three datasets, only Titanic has missing values in categorical features:

• Location of cabin's missing values are important (1st class passengers were most likely to have a cabin) so add new category level "Unknown".

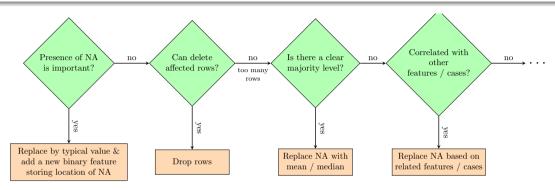

Categorical Variables — Dealing with Missing Values

In terms of our three datasets, only Titanic has missing values in categorical features:

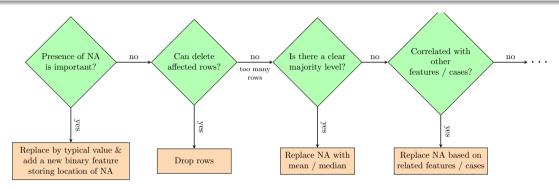

- Location of cabin's missing values are important (1st class passengers were most likely to have a cabin) so add new category level "Unknown".
- Replace Embarked's 2 missing values with mode ("S", 644/891=72%). Note: Use df.Embarked.value_counts(dropna=False) to include missing values in count tables.

Numerical Variables — Dealing with Missing Values

In terms of our three datasets:

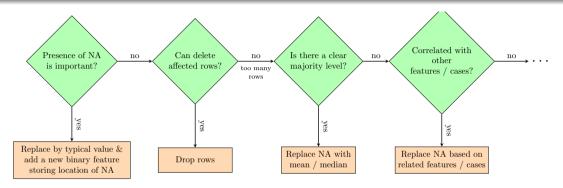

Numerical Variables — Dealing with Missing Values

In terms of our three datasets:

• In Titanic, feature Fare appears to have no missing values, but has 15 zero entries. Are these missing values? or free tickets due to age? ...

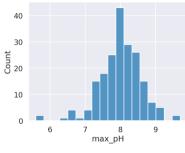

Numerical Variables — Dealing with Missing Values

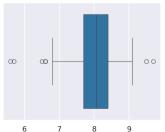

In terms of our three datasets:

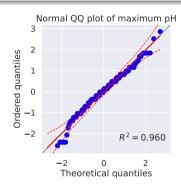

- In Titanic, feature Fare appears to have no missing values, but has 15 zero entries. Are these missing values? or free tickets due to age? ...
- In Algae Blooms, some of the 8 numeric features have NAs ... next few slides.

50 %	8.060000	
75%	8.400000	
max	9.700000	
Name:	<pre>max_pH, dtype:</pre>	float64

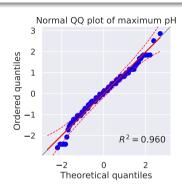

• Data is relatively normal — minor issue with (left) outliers.

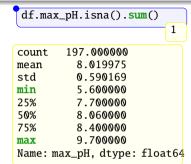

Dataset: Algae Blooms, Feature: max_ph

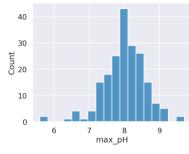

max nH

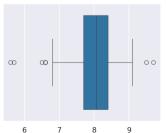

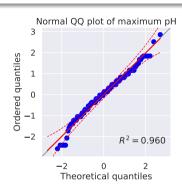

Data is relatively normal — minor issue with (left) outliers.

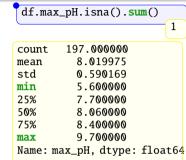

Dataset: Algae Blooms, Feature: max_ph

max nH

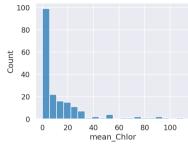

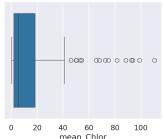

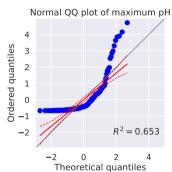

- Data is relatively normal minor issue with (left) outliers.
- ⇒ Will replace (single) NA by mean

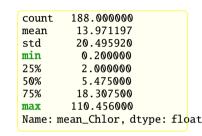

df.max_pH = df.max_pH.fillna(df.max_pH.mean())

Dataset: Algae Blooms, Feature: mean_Chlor

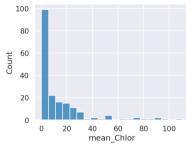

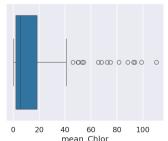

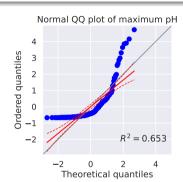

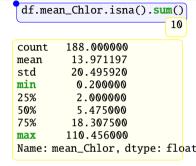

Data is not normal, heavily skewed to the right

Dataset: Algae Blooms, Feature: mean_Chlor

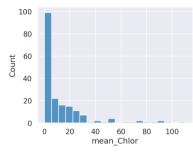

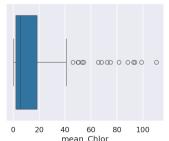

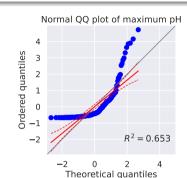

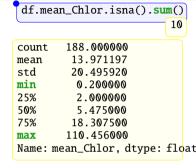

- Data is not normal, heavily skewed to the right
- skew
 pean is a poor representative of the central location.

Dataset: Algae Blooms, Feature: mean_Chlor

- Data is not normal, heavily skewed to the right
- skew
 pean is a poor representative of the central location.
- So will replace (single) NA by median, not the mean

df.mean_Chlor = df.mean_Chlor.fillna(df.mean_Chlor.median()

After Target and Individual Feature Pass — Where are we?

Tips

- Reviewed each feature location, spread, shape, issues.
- No missing values
- total_bill, and total_tip have possible outliers.

After Target and Individual Feature Pass — Where are we?

Tips

- Reviewed each feature location, spread, shape, issues.
- No missing values
- total_bill, and total_tip have possible outliers.

Titanic >

- Reviewed each feature location, spread, shape, issues.
- Generated ToDo list for cleaning, feature extraction
 - Identified features that appear to be related to the target.
 - Feature age has missing values.
 - Feature Fare
 - has 15 measurements with value 0 decide missing value or not.
 - distribution has large outliers and is skewed remove/fix outliers and transform.
 - Feature Name has could be used to obtain new feature Title.
 - ...

Third Pass — Relationships Between Features (and Target)

Correlations

We distinguish later between feature-feature and feature-target correlations

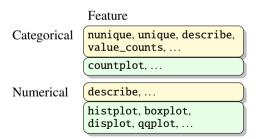

A Selection of Statistical Visualisations and Metrics

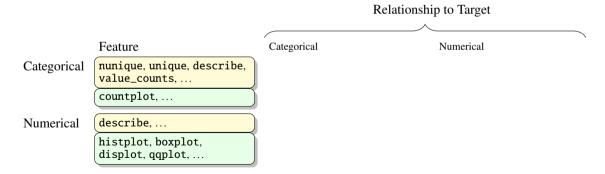

Feature

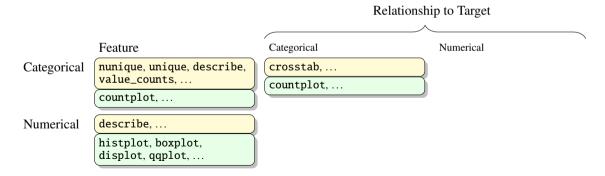

Categorical

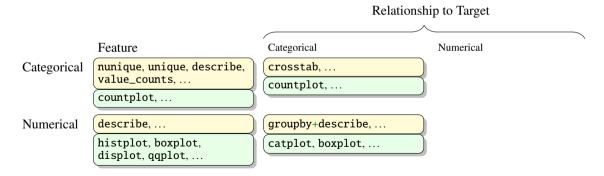

nunique, unique, describe,
value_counts, ...

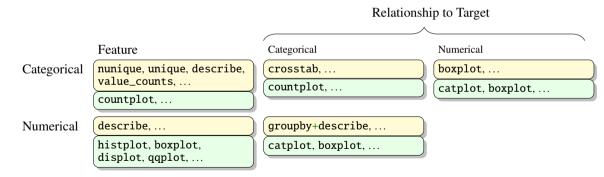

countplot, ...

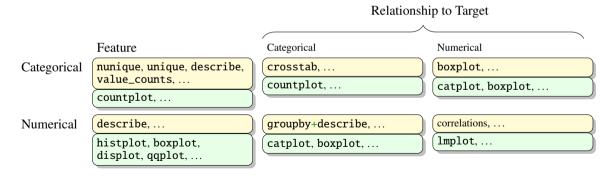

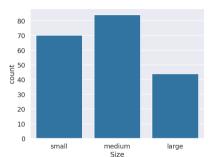

Categorical Variables — Relationship with (Numerical) Target

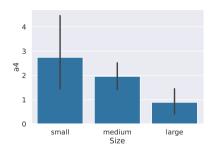

sns.countplot(x="Size", data=df);

 Shows the counts of observations in each categorical level using bar (height/width).

Is it usable?

sns.catplot(x="Size", y="a4", data=df, kind='bar');

- Shows the average level (mean) and uncertainty (std)
 of the numerical target (a4) in each categorical level
 of the categorical variable.
- Vertical bar shows 95% confidence interval.

Is it useful?

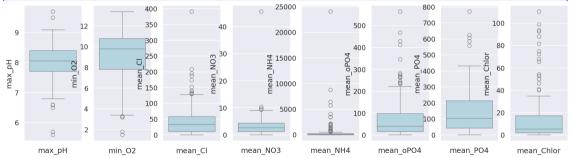

Example — Dataset: Algae_Blooms, Feature: all numeric

```
fig. axs = plt.subplots(1, 8, figsize=(24,6))
for k. c in enumerate(df.columns[3:11]):

                                                                         20000
                                                                                         500
                                                                                                      500
                                                                                                                        100
                                                                                  mean oPO4
                                                                                                 mean PO4
       max_pH
                       min O2
                                     mean Cl
                                                    mean NO3
                                                                   mean NH4
                                                                                                                mean Chlor
```

• Most features are heavily skewed, max_pH appears to be least skewed.

Example — Dataset: Algae_Blooms, Feature: all numeric

```
fig, axs = plt.subplots(1, 8, figsize=(24,6))
for k, c in enumerate(df.columns[3:11]):
    sns.boxplot(data=df, y=c, color="lightblue", ax=axs[k])
    axs[k].set_xlabel(c)
```

- Outliers are much clearer. mean_NH4, mean_N03, and meanCL have clear outliers that need to be addressed.
- On the other hand features like mean_Chlor and mean_oP04 appear to follow a skewed distribution and need to be transformed.

Is there a relationship between feature max_pH and target a1?

Is there a relationship between feature max_pH and target a1?

	max_pH	aı
max_pH	1.000000	-0.268539
a1	-0.268539	1.000000

Is there a relationship between feature max_pH and target a1?

	max_pH	al
max_pH	1.000000	-0.268539
a1	-0.268539	1.000000

(Pearson's) Correlation coefficient, r, measures the strength of a **linear** relationship between two numerical variables.

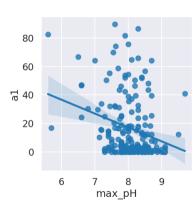

- near zero means no/weak linear relationship.
- near ± 1 zero means strong linear relationship.
- sign indicates direction of relationship

Is there a relationship between feature max_pH and target a1?

(Pearson's) Correlation coefficient, r, measures the strength of a **linear** relationship between two numerical variables.

- near zero means no/weak linear relationship.
- near ± 1 zero means strong linear relationship.
- sign indicates direction of relationship

sns.lmplot(x="max_pH", y="a1", data=df);

Is there a relationship between feature max_pH and target a1?

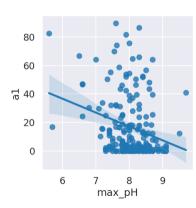

max_pH 1.000000 -0.268539

a1 -0.268539 1.000000

(Pearson's) Correlation coefficient, r, measures the strength of a **linear** relationship between two numerical variables.

- near zero means no/weak linear relationship.
- near ± 1 zero means strong linear relationship.
- sign indicates direction of relationship

sns.lmplot(x="max_pH", y="a1", data=df);

- Correlation coefficient, r = -0.27, shows (at most) a weak negative linear relationship.
- No obvious relationship visible in scatter plot.

Pearson's correlation coefficient,r

is a measure of linear correlation between two variables. Its value lies between -1 and +1, -1 indicating total negative linear correlation, 0 indicating no linear correlation and 1 indicating total positive linear correlation.

Pearson's correlation coefficient, r

is a measure of linear correlation between two variables. Its value lies between -1 and +1, -1 indicating total negative linear correlation, 0 indicating no linear correlation and 1 indicating total positive linear correlation.

Spearman's rank correlation coefficient, ρ

is a measure of monotonic correlation between two variables, and is therefore better in catching nonlinear monotonic correlations than Pearson's r. Its value also lies between -1 and +1, with values near zero indicating no monotonic relation.

Pearson's correlation coefficient, r

is a measure of linear correlation between two variables. Its value lies between -1 and +1, -1 indicating total negative linear correlation, 0 indicating no linear correlation and 1 indicating total positive linear correlation.

Spearman's rank correlation coefficient, ρ

is a measure of monotonic correlation between two variables, and is therefore better in catching nonlinear monotonic correlations than Pearson's r. Its value also lies between -1 and +1, with values near zero indicating no monotonic relation.

Kendall rank correlation coefficient, τ

measures ordinal association between two variables. Its value lies between -1 and +1 with values near zero indicating no relation.

Pearson's correlation coefficient,r

is a measure of linear correlation between two variables. Its value lies between -1 and +1, -1 indicating total negative linear correlation, 0 indicating no linear correlation and 1 indicating total positive linear correlation.

Spearman's rank correlation coefficient, ρ

is a measure of monotonic correlation between two variables, and is therefore better in catching nonlinear monotonic correlations than Pearson's r. Its value also lies between -1 and +1, with values near zero indicating no monotonic relation.

Kendall rank correlation coefficient, τ

measures ordinal association between two variables. Its value lies between -1 and +1 with values near zero indicating no relation.

\rightarrow Phi-k, ϕk

is a new and practical correlation coefficient that works consistently between categorical, ordinal and interval variables, captures non-linear dependency and reverts to the Pearson correlation coefficient in case of a bivariate normal input distribution. Its value also lies between 0 and +1, with values near zero indicating no relation.

Pearson's Correlation Coefficient — Dataset: Algae Blooms

- Categorical variables are not included.
- Suggests best predictors for a1 are mean_P04, mean_oP04, and meanC1.
- mean P04 and mean_oP04 are highly correlated (0.91) could use values of one to estimate missing values of the other.

• Now include categorical variables — Season is not related, but Size and Speed are.

Multi-Relation Plots

sns.boxplot(x="a1", data=df);

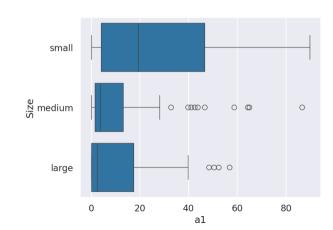

.

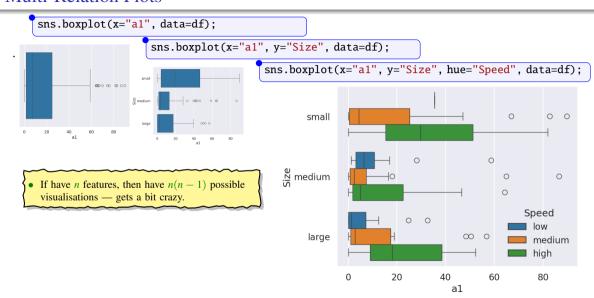

40 a1

sns.boxplot(x="a1", data=df); അനാന താറ

sns.boxplot(x="a1", y="Size", data=df);

Multi-Relation Plots

• Reviewed each feature — location, spread, shape, issues.

- Reviewed each feature location, spread, shape, issues.
- Identified any correlation among features and with target.

- Reviewed each feature location, spread, shape, issues.
- Identified any correlation among features and with target.
- Located and resolved missing values.

- Reviewed each feature location, spread, shape, issues.
- Identified any correlation among features and with target.
- Located and resolved missing values.
- Generated list of possible feature engineering tasks.
