Topic 04 : Exploratory Data Analysis

Part 01: EDA Pass1

Dr Bernard Butler

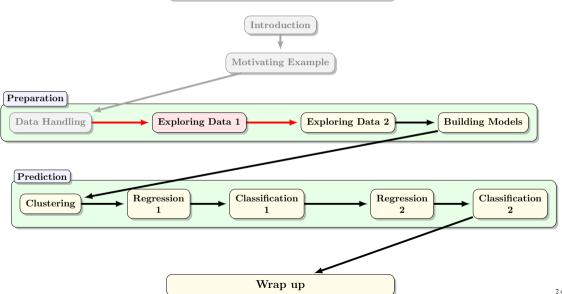

Department of Computing and Mathematics, WIT. (bernard.butler@setu.ie)

Autumn Semester, 2025

Outline

- EDA Process
- Datasets = Tips, Titanic and Algae Blooms
- EDA Pass 1

Data Mining (Week 4)

EDA Pass1 — Summary

- 1. Introduction
- 1.1 Example Datasets
- 1.2 Before we start ...

- 2. First Pass Load Dataset and Initial Clear
- 2.1 dtypes
- 2.2 Missing Values
- 2.3 What have we achieved?

Acknowledgment

A big thanks to Dr Kieran Murphy, who provided many of the slides for today's lecture.

Introduction

Exploratory Data Analysis (EDA)

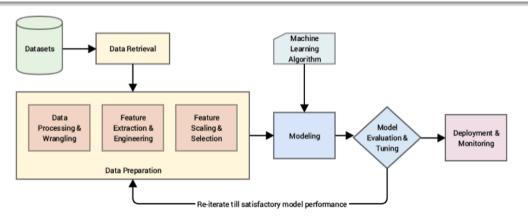

Aim

To understand and summarise a dataset to ensure that the features which are feed to machine learning algorithms are refined and that the results are valid and can correctly interpreted.

Benefits

- Develop insight about the dataset and understanding of the underlying structure.
- Extract important parameters and relationships that hold between them.
- Test underlying assumptions.
- Identify issues that affect model performance outliers, missing values.

Data Pipeline

- Data preparation is the core of the data mining pipeline (typical estimates >50% of the time/effort).
- EDA is the data processing and wrangling.
- EDA informs the feature extraction, engineering, transformation and selection.

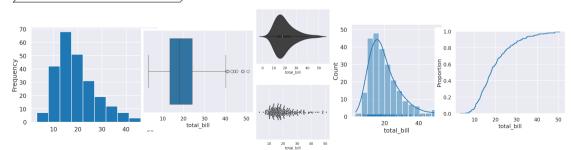

> What questions to ask? >

Dataset global questions: How many features? How many observations? What is the data type of each feature? Any null values? ... Feature specific questions: What is the distribution of each variable? Do there appear to be outliers? What features are related? ... Missing value questions: Are null value a result of the way data was recorded? Can we drop the rows with null values without it significantly affecting your analysis? Can we justify filling in the missing values with the mean or median for that variable? If the data is time-series data, can we fill the missing values with interpolation? Are there so many missing values for a variable that we should drop that variable from the dataset? ... Outlier questions: Why are outliers present? Do the outliers represent real observations (i.e. not errors)? Should we exclude these observations? If not, should we winsorise the values? ... Correlation/Relationships questions: Which variables are most correlated with your target variable? (If applicable) Is there multicollinearity? (Two features that have a correlation > 0.8) How will this affect your model? Do you have variables that represent the same information? Can one be dropped? ...

What questions to ask?

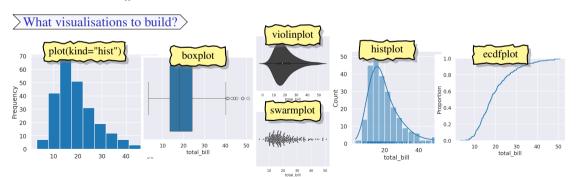

Dataset global questions: How many features? How many observations? What is the data type of each feature? Any null values? ... Feature specific questions: What is the distribution of each variable? Do there appear to be outliers? What features are related? ... Missing value questions: Are null value a result of the way data was recorded? Can we drop the rows with null values without it significantly affecting your analysis? Can we justify filling in the missing values with the mean or median for that variable? If the data is time-series data, can we fill the missing values with interpolation? Are there so many missing values for a variable that we should drop that variable from the dataset? ... Outlier questions: Why are outliers present? Do the outliers represent real observations (i.e. not errors)? Should we exclude these observations? If not, should we winsorise the values? ... Correlations/Relationships questions: Which variables are most correlated with year information? Can one be dropped? ...

What visualisations to build?

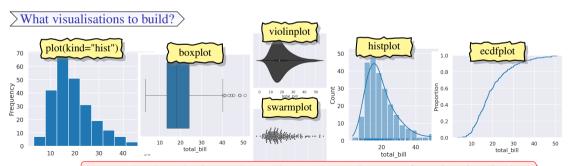

What questions to ask?

- A labeled dataset consists of m rows \times (n+1) columns / variables.
- Use bold to represent vectors and matrices.

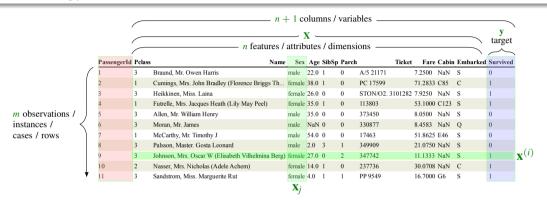

- A labeled dataset consists of m rows \times (n+1) columns / variables.
- Use bold to represent vectors and matrices.
- Use subscripts to indicate particular feature / attribute / column

 \mathbf{X}_{j}

- A labeled dataset consists of m rows \times (n+1) columns / variables.
- Use bold to represent vectors and matrices.
- Use subscripts to indicate particular feature / attribute / column
- Use superscript in parenthesis to indicate particular observation / instance/ case / row

- A labeled dataset consists of m rows \times (n+1) columns / variables.
- Use bold to represent vectors and matrices.
- Use subscripts to indicate particular feature / attribute / column

• Use superscript in parenthesis to indicate particular observation / instance/ case / row

• So $x_j^{(i)}$ (or $x_{i,j}$) is the *i*-th observation in the *j*-th feature

We will use a few datasets today to illustrate the various features:

Titanic

Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

• Small dataset of total bills, and tips for different servers with gender, day, time and group size.

Titanic

Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.

\(\) Titanic

> Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

Titanic

> Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

> Titanic

• Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.

Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

> Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).

Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

> Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).
- Task: classification predict whether a passenger survived.

> Algae Blooms

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

> Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).
- Task: classification predict whether a passenger survived.

Algae Blooms

• Water quality study where samples were taken from different rivers over time.

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).
- Task: classification predict whether a passenger survived.

Algae Blooms

- Water quality study where samples were taken from different rivers over time.
- Recorded levels of (seven) chemical substances and population of (six) algae species and other information on the sample conditions.

We will use a few datasets today to illustrate the various features:

Tips

- Small dataset of total bills, and tips for different servers with gender, day, time and group size.
- Clean, no missing values, some outliers.
- Task: exploratory data analysis

>Titanic

- Classic dataset with passenger information for the Titanic's fatal voyage, and whether they survived.
- Has missing values and information rich text fields (Name, ticket number).
- Task: classification predict whether a passenger survived.

Algae Blooms

- Water quality study where samples were taken from different rivers over time.
- Recorded levels of (seven) chemical substances and population of (six) algae species and other information on the sample conditions.
- Task: regression predict algae population level (7 separate populations).

	total_bill	tip	sex	smoker	day	time	siz
(0 16.99	1.01	Female	No	Sun	Dinner	2
	1 10.34	1.66	Male	No	Sun	Dinner	3
:	2 21.01	3.50	Male	No	Sun	Dinner	3
:	3 23.68	3.31	Male	No	Sun	Dinner	2
4	4 24.59	3.61	Female	No	Sun	Dinner	4
!	5 25.29	4.71	Male	No	Sun	Dinner	4
(6 8.77	2.00	Male	No	Sun	Dinner	2
'	7 26.88	3.12	Male	No	Sun	Dinner	4
3	B 15.04	1.96	Male	No	Sun	Dinner	2
9	9 14.78	3.23	Male	No	Sun	Dinner	2

No target column, so mainly just an exploratory data analysis problem. But questions of interest:

- How do factors sex, smoker, day, time, or size affect tip / percentage tip?
- Does size vary with day, time, smoker?

But some questions don't make sense

 What is the relationship between sex and smoker? — why should they be related?

This is the downside of automatic EDA tools such as pandas-profiling — you will drown in statistics / charts.

Algae Blooms dataset

Introduction

Before we start ... Loading libraries

We start by loading in the core data science modules...

import numpy as np import pandas as pd import matplotlib.pyplot as plt

Before we start ... Loading libraries

We start by loading in the core data science modules...

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

matplotlib is an excellent visualisation library but some plots needs additional configuration. seaborn sits above matplotlib and has a collection of visualisations optimised for statistical analysis. . . .

```
import seaborn as sns
```

Before we start ... Loading libraries

We start by loading in the core data science modules...

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

matplotlib is an excellent visualisation library but some plots needs additional configuration. seaborn sits above matplotlib and has a collection of visualisations optimised for statistical analysis. . . .

ates more details and nicer visualisations.

```
import seaborn as sns
```

Next, we import some statistical modules ...

import scipy.stats as stats
import statsmodels.api as sm
import pingouin as pg

scipy.stats has a large number of distributions, parametric and nonparametric statistical tests, and descriptive statistics.
statsmodels is more focused on estimating statistical models.
pingouin overlaps with bits of scipy.stats and statsmodels but gener-

Before we start ... Loading libraries

We start by loading in the core data science modules...

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
```

matplotlib is an excellent visualisation library but some plots needs additional configuration. seaborn sits above matplotlib and has a collection of visualisations optimised for statistical analysis. . . .

ates more details and nicer visualisations.

```
import seaborn as sns
```

Next, we import some statistical modules ...

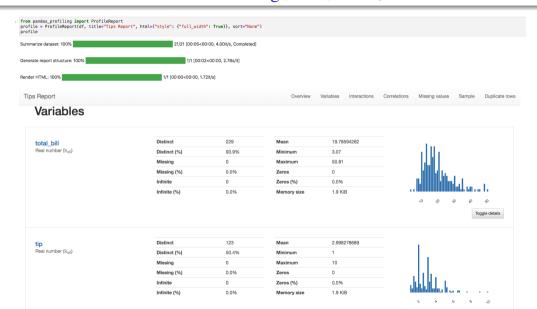

```
import scipy.stats as stats
import statsmodels.api as sm
import pingouin as pg
```

scipy.stats has a large number of distributions, parametric and nonparametric statistical tests, and descriptive statistics.
statsmodels is more focused on estimating statistical models.
pingouin overlaps with bits of scipy.stats and statsmodels but gener-

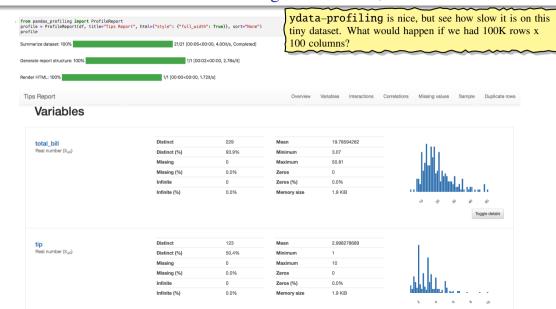

Finally we set options ...

```
plt.style.use("seaborn-v0_8-darkgrid")
```

Before we start ... auto EDA using ydata-profiling

Before we start ... auto EDA using ydata-profiling

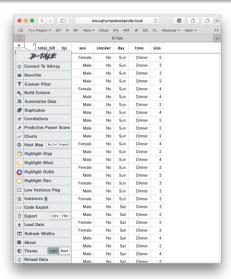

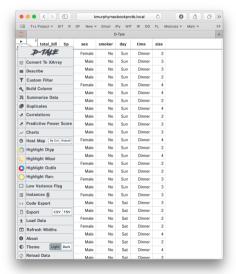

Well, almost zero code....

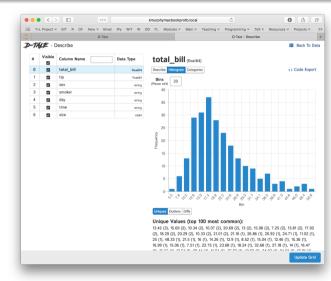

```
import pandas as pd
import dtale

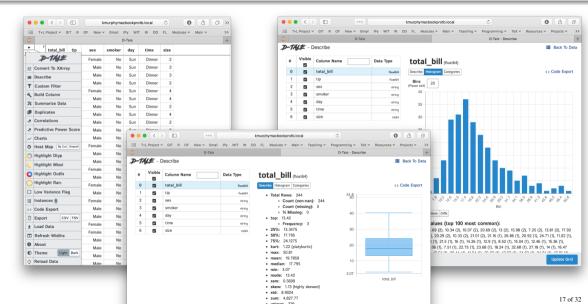

# Read the Tips data into a dataframe, check it looks OK
df = pd.read_csv('tips.csv')
df.head()

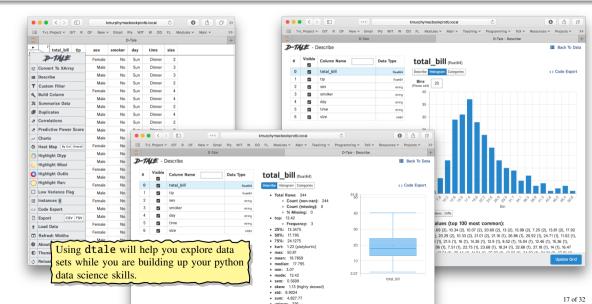

# Run dtale to visualize the structure of the dataframe
dtale.show(df)
```

First Pass — Load Dataset and Initial Clean

- Load dataset
- Check variables names
- Verify variable types
- Identify (and possibly address) missing values

Tips — Load

```
df = pd.read_csv("data/tips.csv")
print(df.shape)
df.head(10) (244, 7)
```

	total_bill	tip	sex	smoker	day	time size

Issue: categorical data treated as object (string).

Tips — Fix Data Types

```
df.sex.unique()
array(['Female', 'Male'], dtype=object)

df.sex = pd.Categorical(df.sex)
df.sex.unique()

['Female', 'Male']
Categories (2, object): ['Female', 'Male']
```

Tips — Fix Data Types

```
df.sex.unique()
array(['Female', 'Male'], dtype=object)

df.sex = pd.Categorical(df.sex)
df.sex.unique()

['Female', 'Male']
Categories (2, object): ['Female', 'Male']
```

```
df.smoker = pd.Categorical(df.smoker)
df.smoker.unique()

['No', 'Yes']
Categories (2, object): ['No', 'Yes']
```

array(['No', 'Yes'], dtype=object)

df.smoker.unique()

Tips — Fix Data Types

```
df.sex.unique()
                                                      df.smoker.unique()
array(['Female', 'Male'], dtype=object)
                                                      array(['No', 'Yes'], dtype=object)
df.sex = pd.Categorical(df.sex)
                                                      df.smoker = pd.Categorical(df.smoker)
df.sex.unique()
                                                      df.smoker.unique()
['Female'. 'Male']

df.info()

Converting to category will:

- Simplify visualisation (order can be preserved).
- Reduce memory usage (not that big a deal for us).
- Speed up I/O (depending on file format).
- ⇒ Convert to category is a bigger deal for features where the levels have an order.

Now some variables have missing values

Also we should convert Season, Size and Speed to category and ensure the levels are ordered.

geIndex: 200 entries. 0 to 199 a columns (total 18 columns): Column Non-Null Count Dtype object Season 200 non-null Size 200 non-null object Speed 200 non-null object 199 non-null float64 max_pH min_02 198 non-null float64 mean Cl 190 non-null float64

Rows / Cols to drop?

df.loc[df.isna().sum(axis=1)==6]

Season Size Speed max pH min O2 mean Cl mean NO3 mean NH4 mean oPO4 mean PO4 mean Chlor

61 summer small medium 6.4 NaN NaN NaN NaN NaN 14.0 NaN 198 winter large medium 8.0 7.6 NaN NaN NaN NaN NaN NaN

df = df.loc[df.isna().sum(axis=1)<6].copy()</pre> print(df.shape) (198, 18)

Step 1: Replace missing values with marked values. Examples:

- Step 2: Count the missing values by row and by column.
- Step 3: If a row or a column has too many(?) missing values, either drop it or add an extra boolean-valued feature df [hasCol]

df[col].replace('XXXXXX',np.nan) or df[col].replace(",None)

- Step 4: If future processing can handle data with missing values, skip to step 7.
- Step 5: Otherwise, replace the missing values with representative(?) values...
- Step 5a: If the data is categorical, use a safe value such as its mode (the most commonly occurring value)
- Step 5b: If the column is numeric, unsorted, symmetrically distributed, without outliers, try df[col].fillna(df[col].mean(), inplace=True)
- Step 5c: If the column is numeric, unsorted, but is unsymmetically distributed and/or has outliers, try df[col].fillna(df[col].median(), inplace=True)
- Step 6: If the column is numeric and sorted by row index, df[col].interpolate() can fill in values, so 1, 3, 7, 8 becomes 1, 3, 5, 7, 8.
- Step 7: Proceed to EDA Pass 2

Tips

- ✓ Loaded data, corrected dtypes (categorical with order levels)
- ✓ Sanitised column names not needed, but note column name size shadows pandas dataframe function size ⇒ so use df["size"] instead of df.size.
- No missing values

Tips

- ✓ Loaded data, corrected dtypes (categorical with order levels)
- Sanitised column names not needed, but note column name size shadows pandas dataframe function size \Rightarrow so use df["size"] instead of df. size.
- ✓ No missing values

>Titanic >

- ✓ Loaded data no conversion of dtypes needed (but if you don't plots/crosstab order won't agree)
- Sanitised column names not needed.
- Missing values in Age (177/891=20%), Cabin (687/891=77%), and Embarked (2/891=0.2%).
 - A feature with 77% missing values should be considered for deletion, but what if the presence of a missing value actually tells us something? \Rightarrow convert to a boolean feature.

Tips

- ✓ Loaded data, corrected dtypes (categorical with order levels)
- Sanitised column names not needed, but note column name size shadows pandas dataframe function size \Rightarrow so use df["size"] instead of df.size.
- ✓ No missing values

>Titanic >

- Missing values in Age (177/891=20%), Cabin (687/891=77%), and Embarked (2/891=0.2%).
 - A feature with 77% missing values should be considered for deletion, but what if the presence of a missing value actually tells us something? \Rightarrow convert to a boolean feature.

Algae Blooms

- ✓ Loaded data, corrected dtypes (categorical with ordered levels)
- Sanitised column names.
- Missing values
 - Removed two rows with 6 NA each, accounted for 12/33=36% of the missing values.
 - Remaining, 21 NAs are concentrated in mean_CL (8) and mean_Chlor (10). EDA will suggest options.

Next we might

- Save result of initial clean:
 - To either a CSV (if we don't mind losing dtype metadata)

```
df.to_csv('data/Analysis.csv', index=False)
```

• To (say) pickle format (to keep dtype metadata)

```
df.to_pickle('data/Analysis.pkl')
```

Later can read dataframe back in using

```
df = pd.read_pickle('data/Analysis.pkl')
print(df.shape)
df.head(1)
```

• If the dataset is large (>100K rows), save a (reproducible) sample of the dataset for later EDA to speed up calculations (especially visualisations).

```
df.sample(frac=.25, random_state=42).to_pickle('data/Analysis_sample.pkl')
```

End of Pass 1...
